

Pre-Training Music Classification Models via Music Source Separation – Qualitative Results (in MTAT)

From a qualitative standpoint, our proposed framework, when pre-trained with vocal separation, can better differentiate between vocals (especially female ones) and instrumental excerpts. Indeed, high-pitched instrumental excerpts (such as in the excerpt in the left, highlighted) are more often correctly recognized as a non-vocal part, while mistaken for such in the baseline CNN; conversely, instances of sustained female notes (such as in the excerpt in the right, highlighted) are more likely to be correctly detected as such by our framework, compared to the baseline.

A demonstrator page with more examples will be soon set up!
